Using the wordle dev application
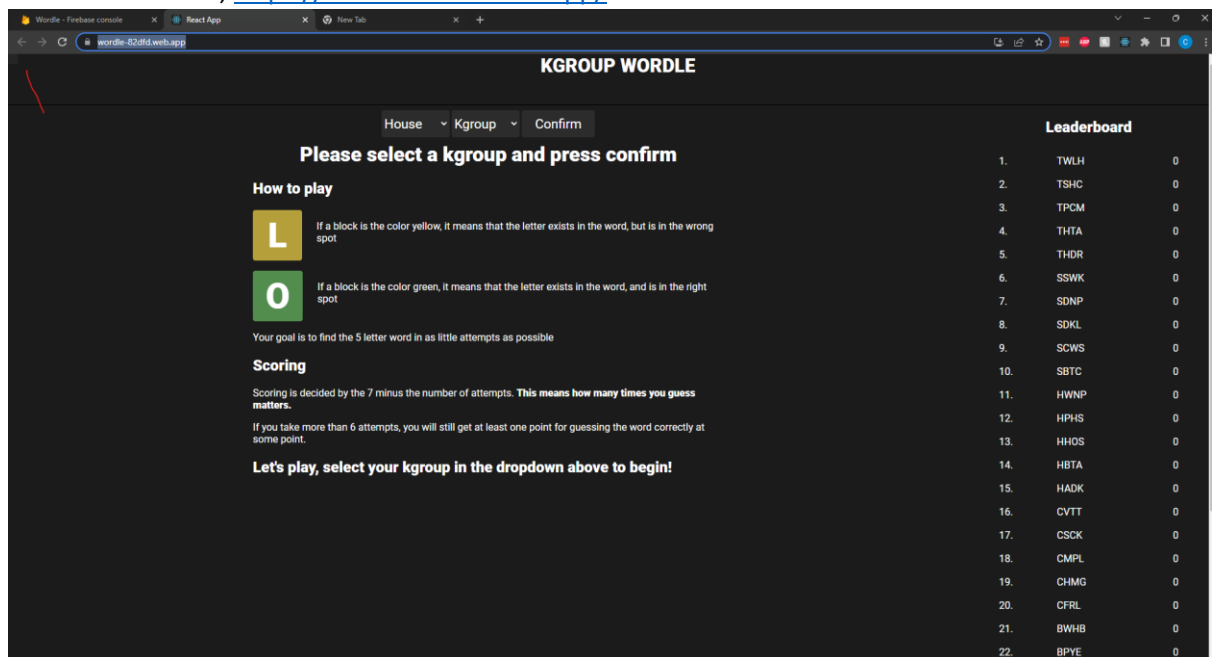

URL: https://wordle-82dfd.web.app/

Distribute this link to all the kgroup teachers, Mrs. Skilleter was able to do this for us last year, however your emails can too.

Pushing to the firebase hosting service can be a bit hard, however I will share it with you regardless and the code on github, do note the code does not look good.
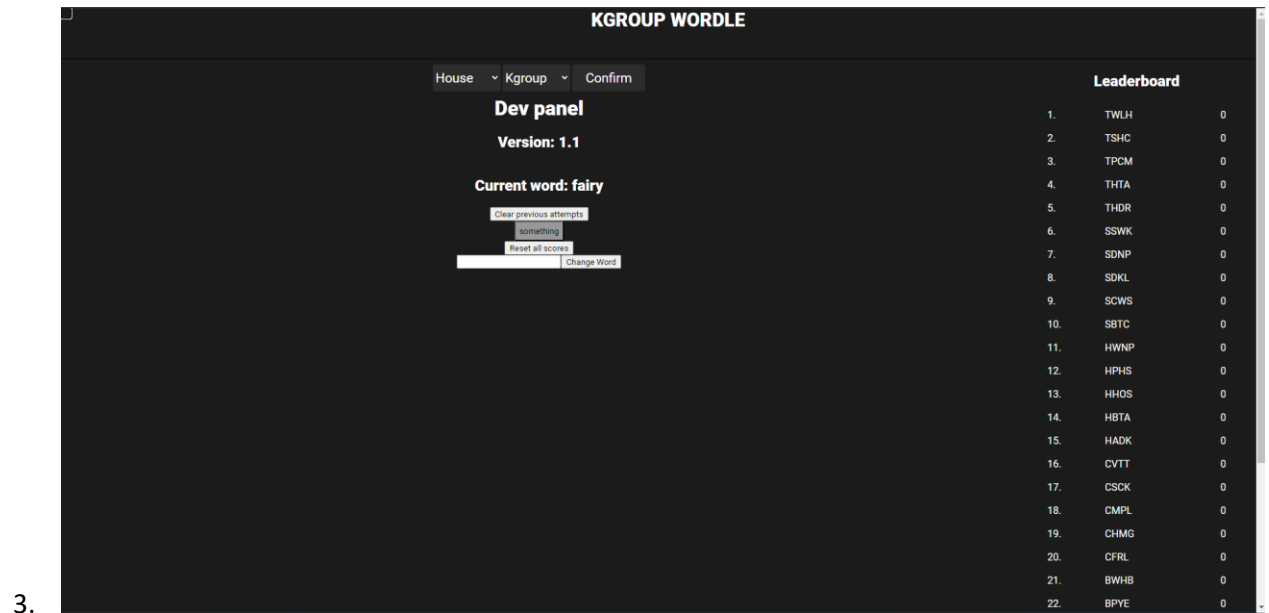

Changing the word:

Unfortunately only paid version of firebase and other hosting services can update databases at a certain time each week, so we have to manually do it ourselves.

1. Go to the website, https://wordle-82dfd.web.app/

2. Hovering over the very top left corner(Indicated in image above) of the screen should change your cursor to the "your hovering over a button one" click on that and you'll access the dev menu
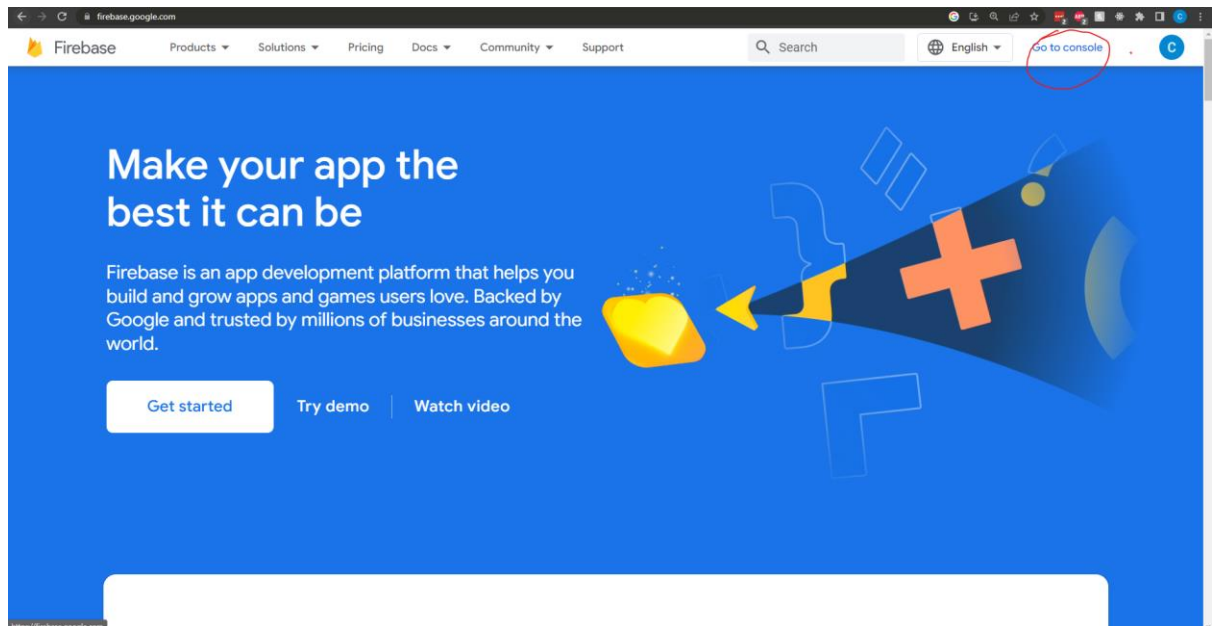

3.

Once in the dev menu, there are various buttons needed to run the game.

-Clear previous attempts: **must be done weekly(or however often you are running the worlde).** This removes all the previous words the kgroup has put in. If not done they will attempt the new word, however their old responses will show up

- something – idk what that does, I think I got bored one day and made something and forgot to delete it

- Reset all scores, it's self explanatory, however there is no conformation so once you click it everything goes to zero

- Change word, enter your word into the text box and click change word, this will not update the current word field above, however it should update when you refresh the page. **When changing word make sure everything is in lowercase (I can't remember if I patched that error or not, just stick with lowercase regardless)**
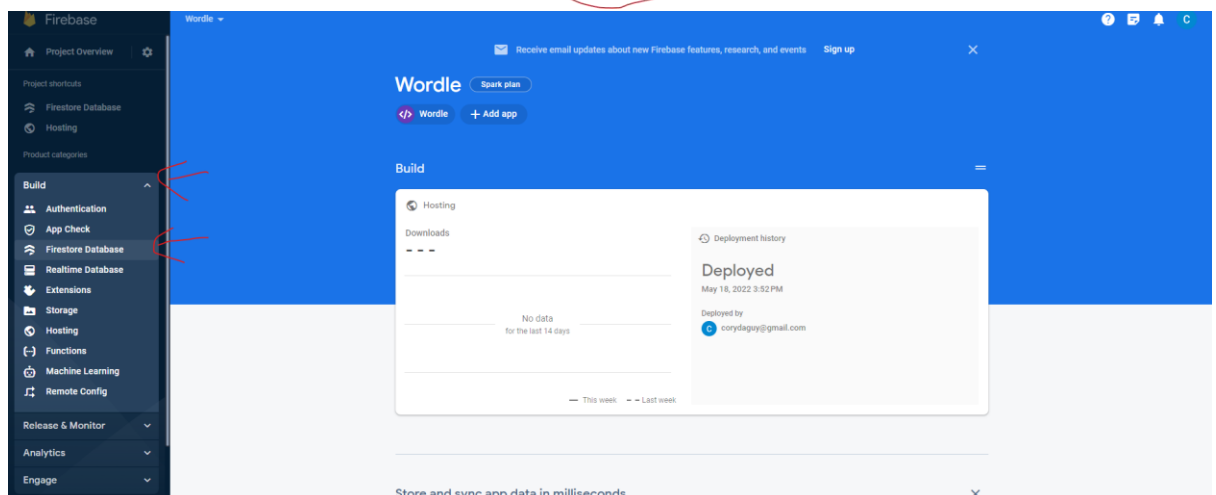

Accessing the database:

Login with your respected google account you have shared with me.

1.
Click go to console

2.

3.
Open build then go to firestore database

Reading the database:

Leaderboard section

- Last attempt: when the last attempt was done by the k group
- Name: the name of the k-group as shown on the leaderboard and dropdown menu
- Score, the score of the k-group summed. Calculated by 6 – no. attempts

- Addresses: don't worry about that, it was something I put on every computer to see if k-groups were cheating, which some definitely were. Cheating was done by attempting it on another k-group before doing it on theirs in the first attempt.
- Attempts: an array(or dictionary idk) of all the attempts the k-group did. This should be cleared weekly via the clear previous attempts button in the dev panel.

Words section:

Only currentWord bothers you. This is the word that gets changed in the dev panel. If the dev panel struggles to change the word, just reset here and text me about it.
